The video quality isn't the best and i don't have any explanation of it. Can you tell me what you see in the problem? It's for a performance in Argentina. A: In short: You have turned down the bass so much that the bass pedal cannot play. In detail: It seems to be the wrong notes in Bb (from the bass line) playing the C. The bottom right hand is badly out of tune with the main part and is playing a C. (you can see it's out of tune on the next measure) Maybe it is pitch shifted?. It is also affecting your right hand. You have all notes playing too softly, that way the bass is only producing his bass notes. If you turn down the bass and the right hand they can hear your notes, but if you play too softly, they will still be very quiet. If you lower the bass, it will become more audible, but you will also need to play the right hand more loudly. This is because they are pitched in such a way that the more you lower the bass, the higher you play, and then the lower you are playing, the lower the notes are pitched.
